

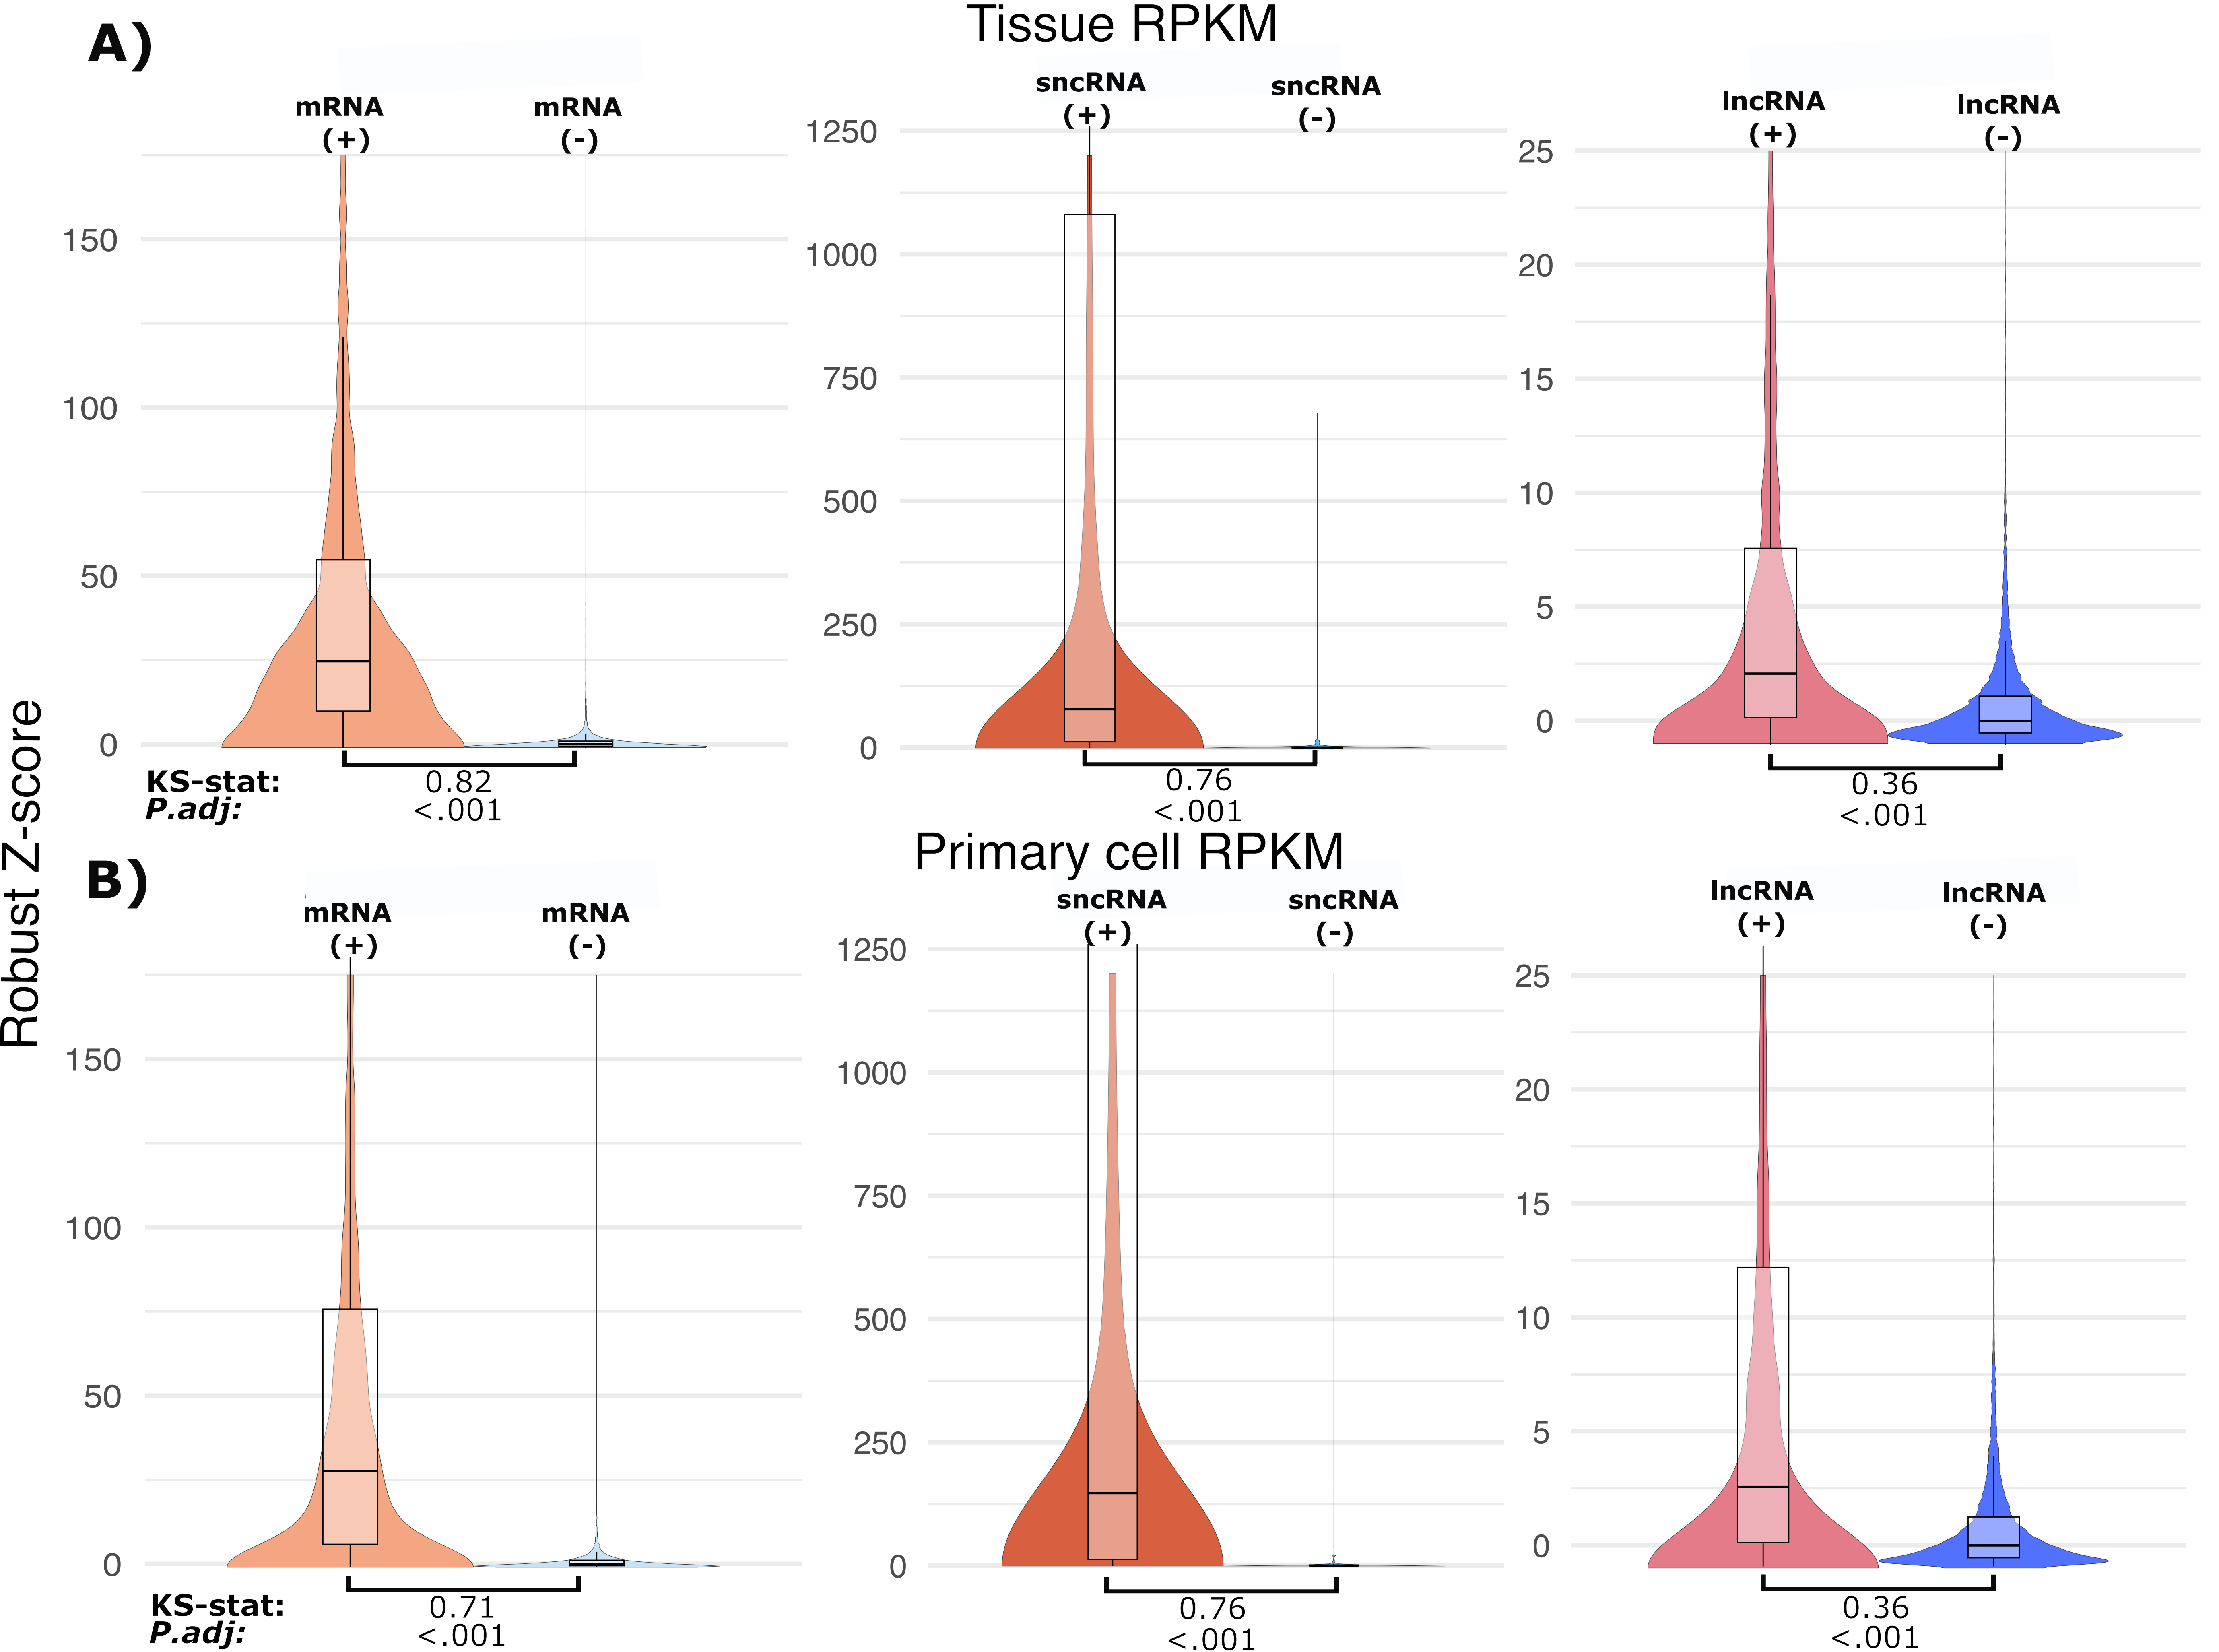

Figure 2. Violin plot and box plots for the distribution of transcriptome-data. A-B) Robust Z-scores for genic and non-genic maximum RPKM across samples (i.e. the highest normalized expression value from RNA-seq data, summarised as reads per kilobase per million (RPKM) mapped reads). Robust Z-scores are computed based upon median, and median-absolute-deviation values from the non-genic controls (A) corresponds to tissue samples, (B) corresponds to primary cell samples. Signed Kolmogorov-Smirnov statistics and adjusted p-values comparing genic and non-genic controls are displayed under each comparison.
