

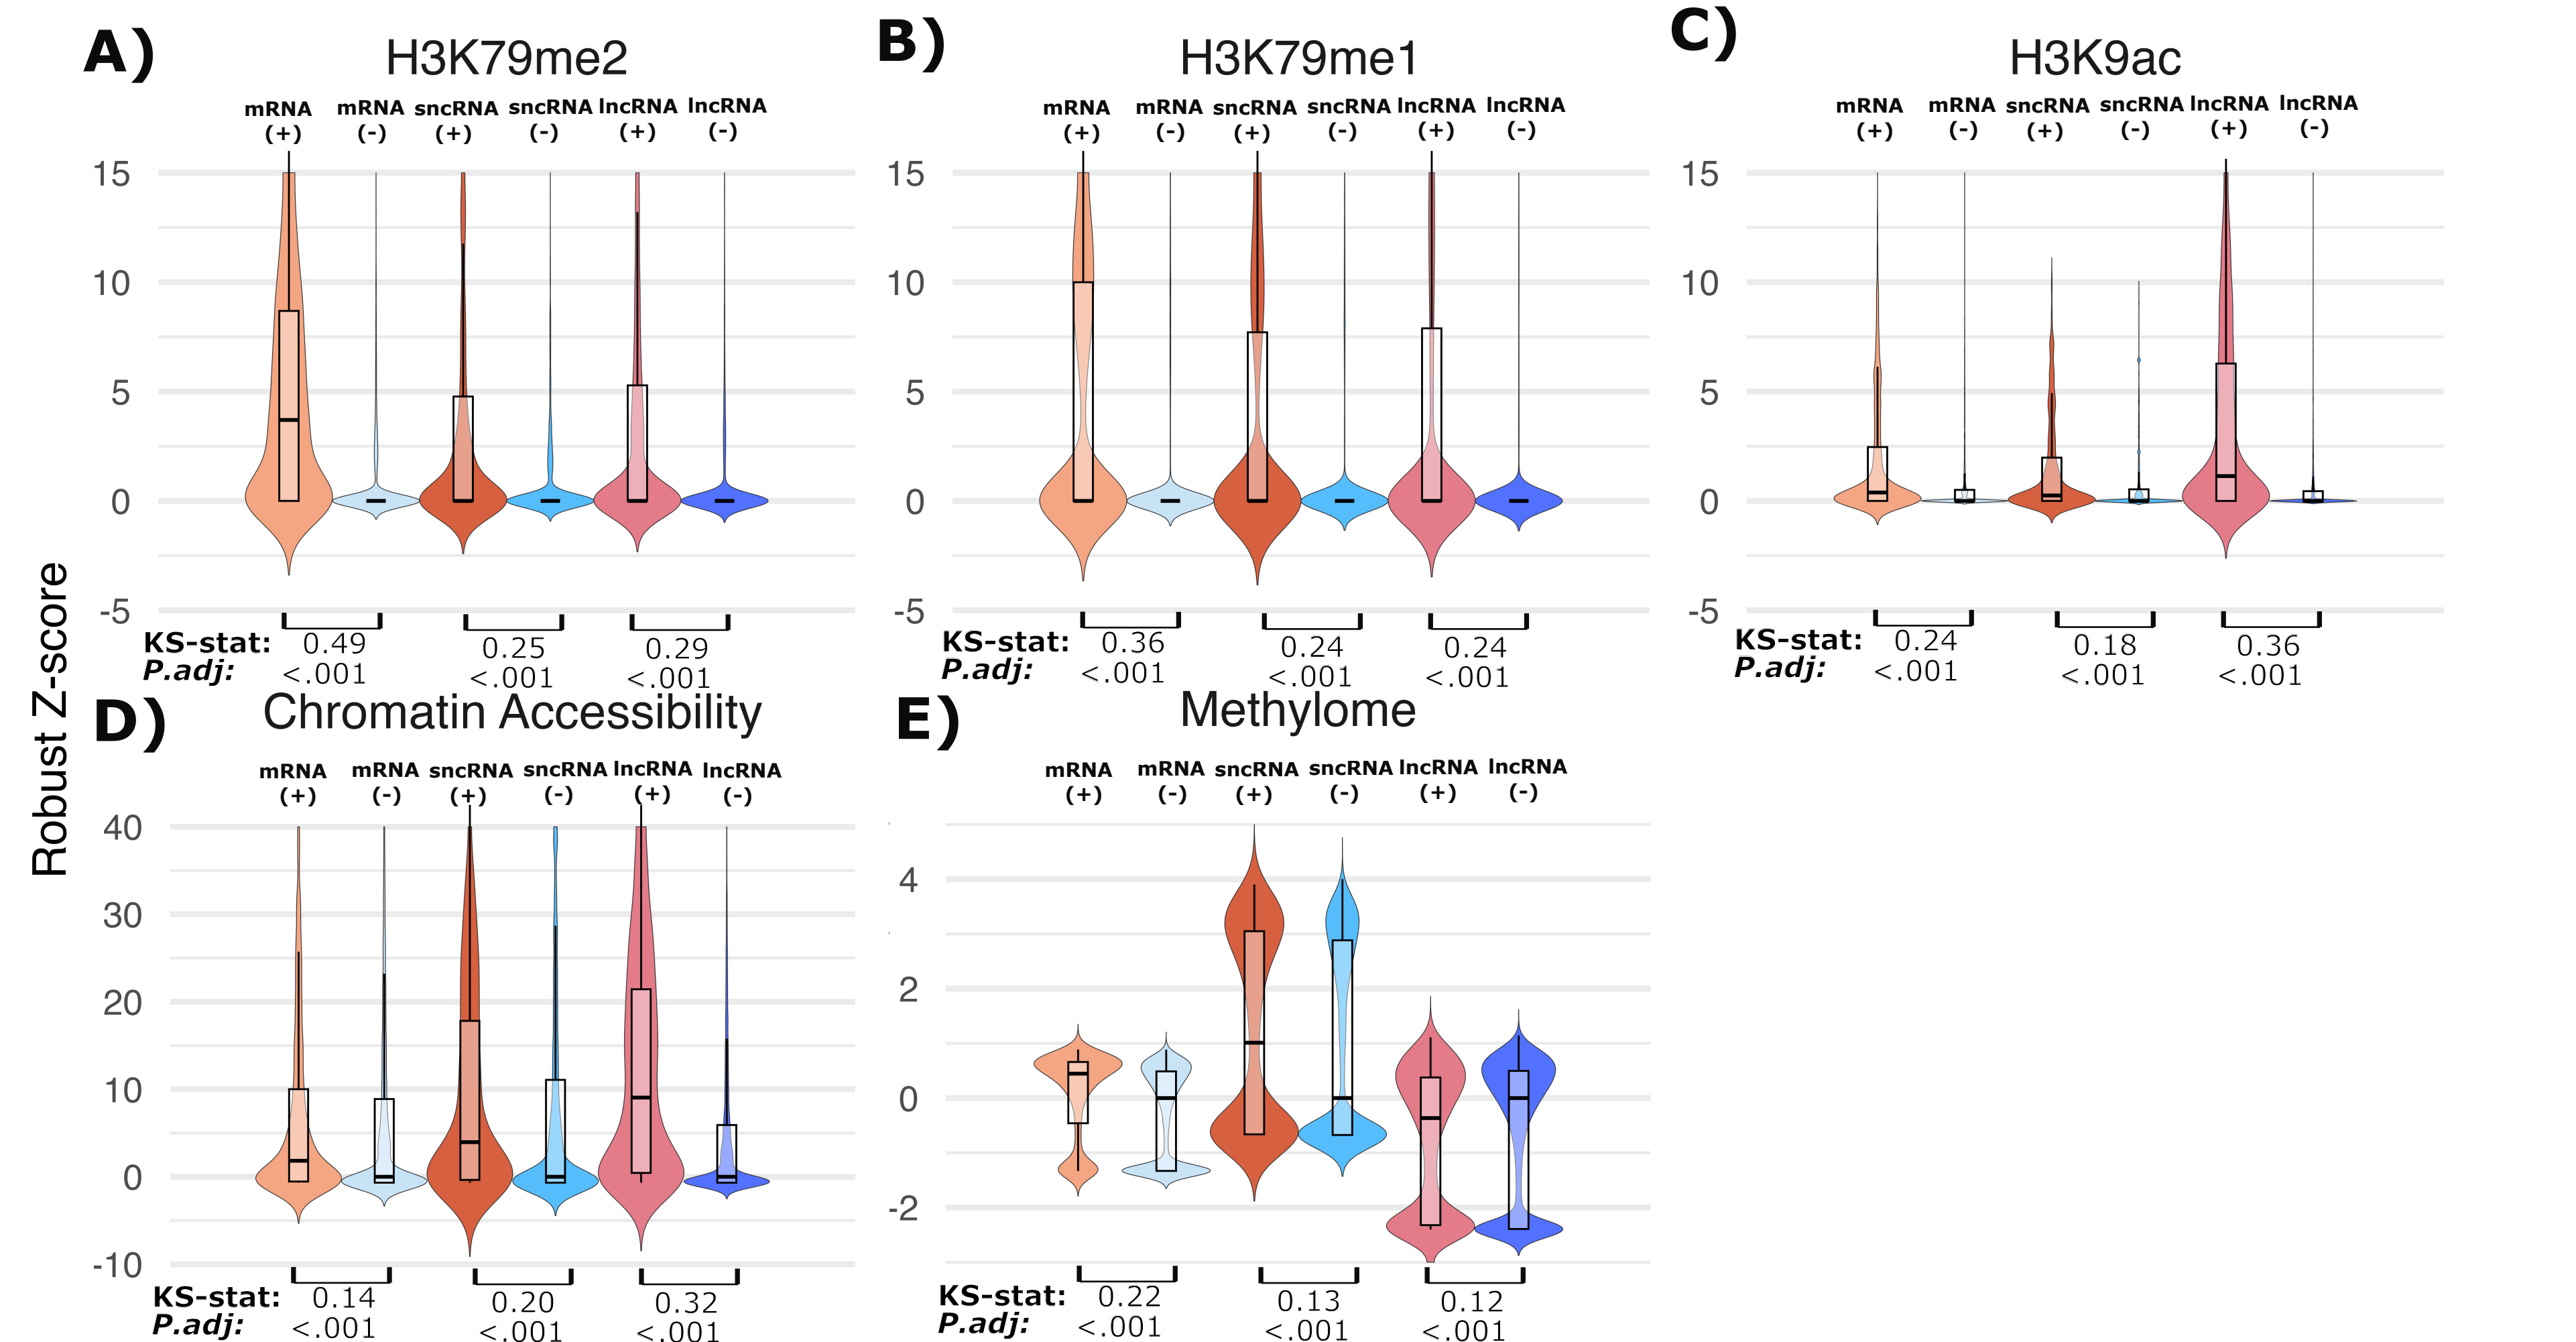

Figure 4. Violin plot and box plots for the distribution of epigenetic features based on robust z-scores for genic and matched non-genic regions. A-C) H3K79me2, H3K79me1 and H3K9ac, maximum signal value for these histone marks from ChIP-seq data. D) Chromatin Accessibility, the maximum signal value for open chromatin regions from DNase-seq and ATAC-seq data. E) Methylation, the average methylation level at CpG sites from bisulphite-sequencing data. All “epigenetic” data was sourced from the ENCODE3 repository. The signed Kolmogorov-Smirnov statistics and adjusted p-values are displayed under each comparison.
