

Figure 5. Violin plot and box plots for the distribution of mRNA and ncRNA specific features based on robust z-scores for genic and matched non-genic regions. A&B) Fickett and RNAcode, coding potential based on a measure of nucleotide composition bias and positional asymmetry/ or evolutionary signatures of purifying selection on synonymous sites within multiple sequence alignments, respectively. C) Interactions, average interaction free energies between sequences and 34 abundant human ncRNAs from RNACentral. D) Covariance, measure of evolutionary pressure to maintain RNA base-pair interactions, reflecting structural constraints. E) MFE, lowest thermodynamic energy of the most stable predicted RNA secondary structure. Signed Kolmogorov-Smirnov statistics and adjusted p-values are displayed under each comparison.
