

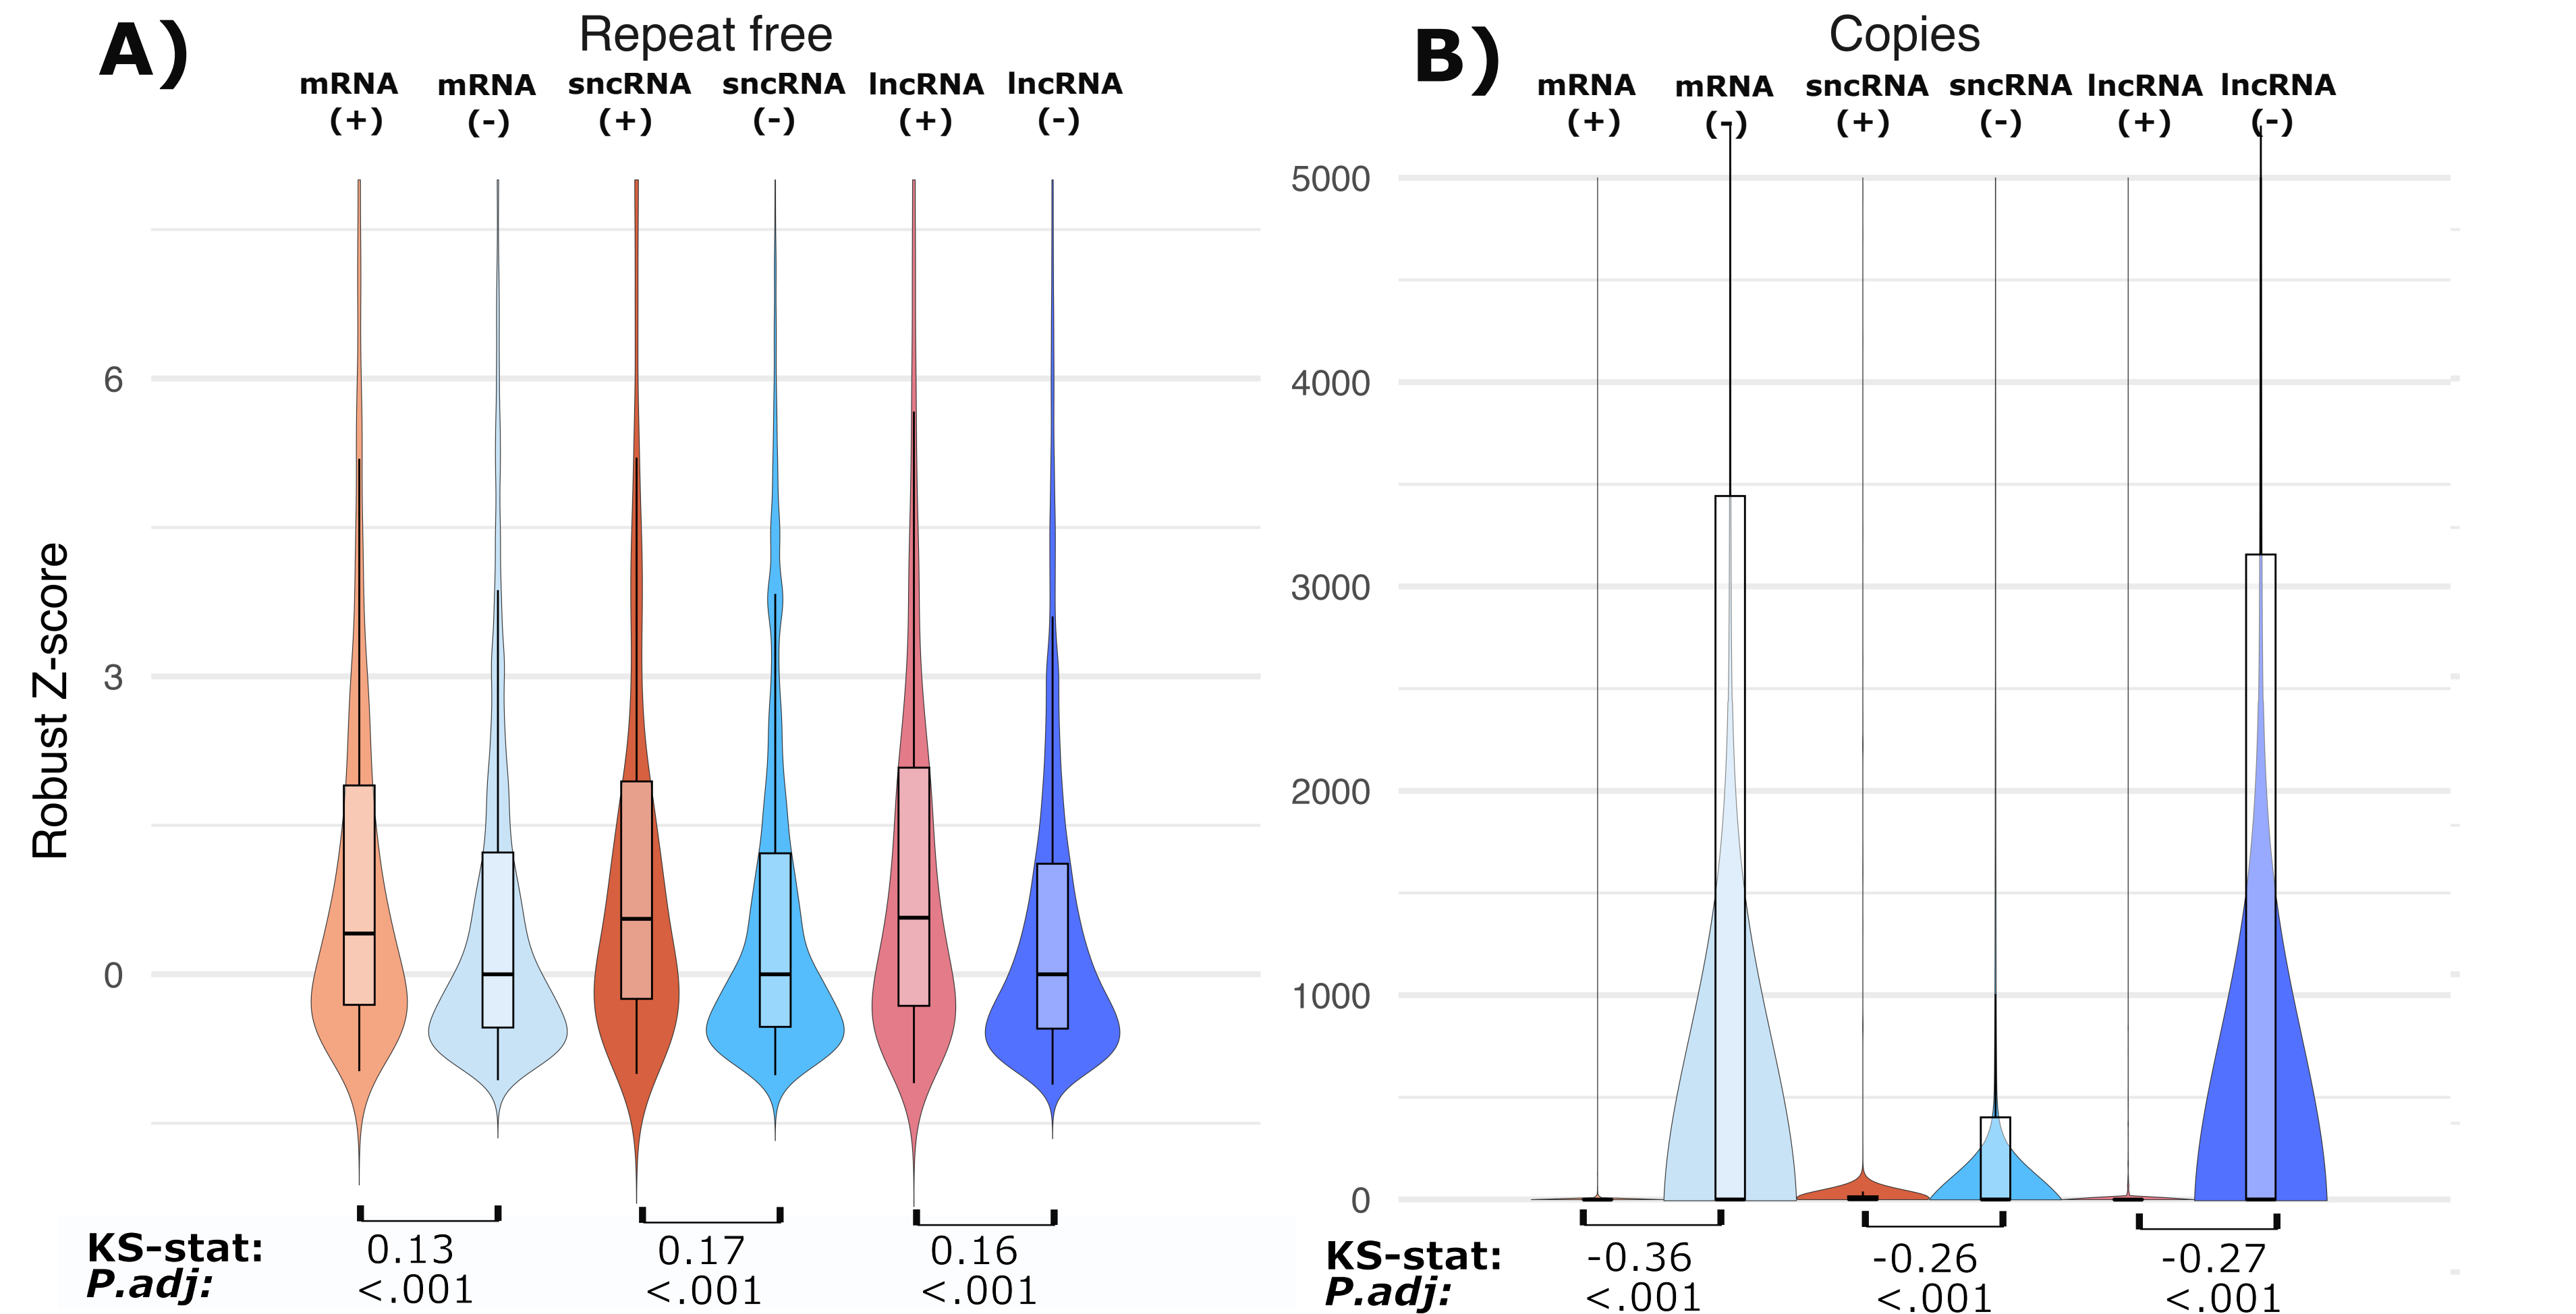

Figure 6. Violin plot and box plots for the distribution of repeat association features based on robust z-scores for genic and matched non-genic regions. A) Repeat free, combined distance to nearest up and downstream repeat elements (SINE, LINE, etc) that does not overlap each control sequence. B) Copies is the genomic copy number of each analyzed region as determined by MMseqs2 searches of the GRCh38 genome. Signed Kolmogorov-Smirnov statistics and adjusted p-values are displayed under each comparison.
