

c) SNP density distribution by RNA type

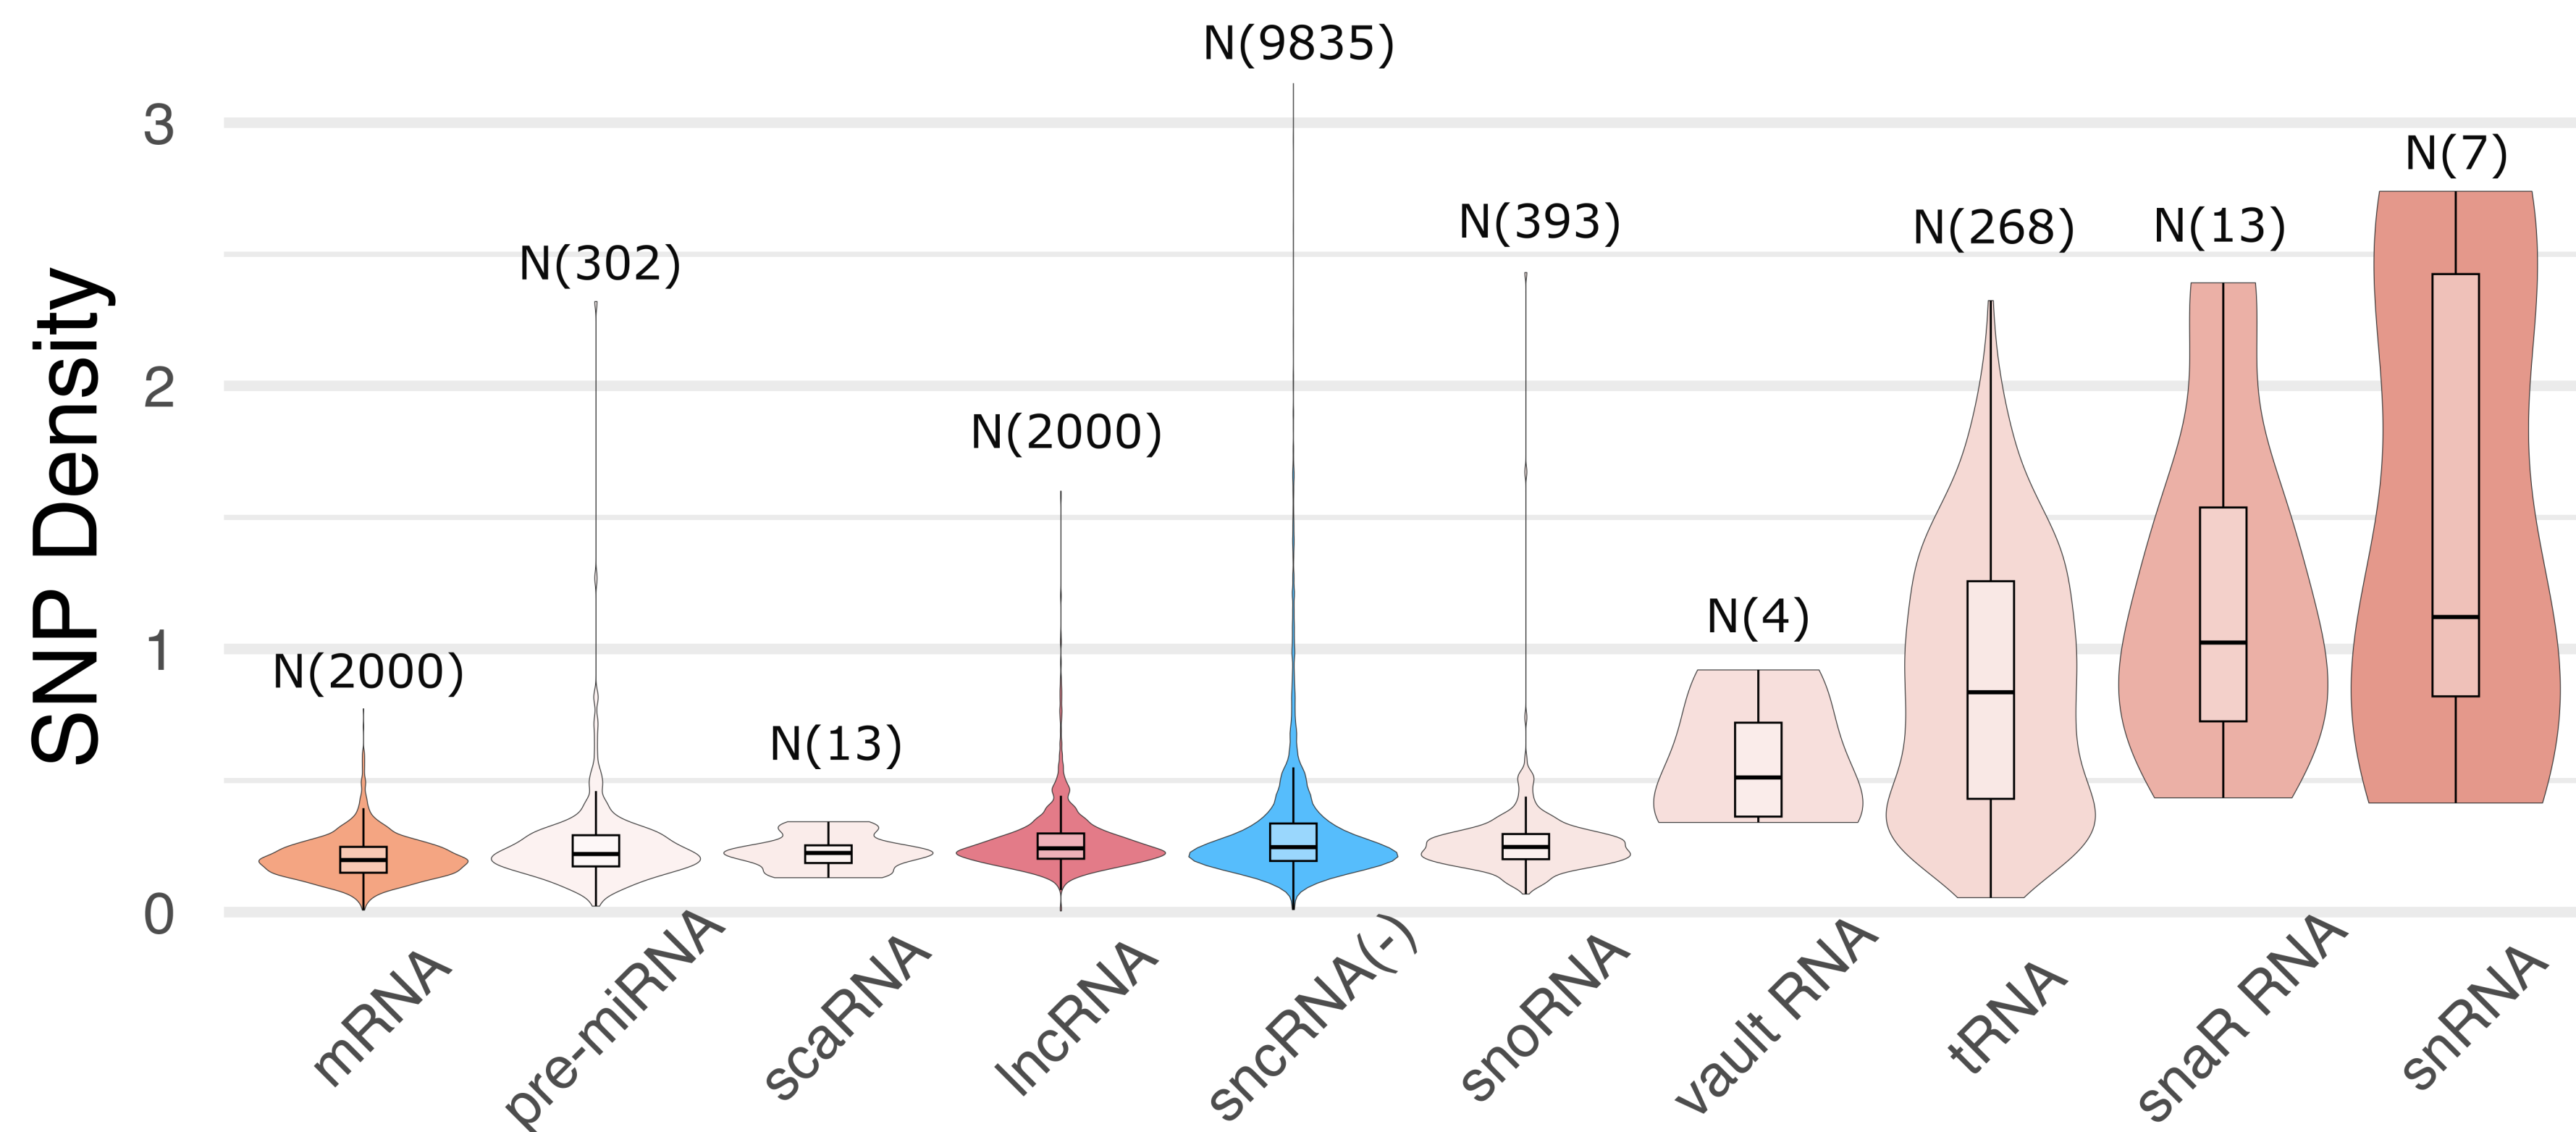

Figure 7. Violin plot and box plots for the distribution of population variation features based on robust z-scores for genic and matched non-genic regions. A) SNP density, measured by the number of SNPs/sequence length. B) MAF is the mean minor allele frequency across all SNPs in a region, where the minor allele frequency is the population frequency of the least common allele at each variant site. C) The SNP density distribution categorized by small non coding RNA types used in this study. Signed Kolmogorov-Smirnov statistics and corresponding adjusted p-values are displayed under each comparison.
