

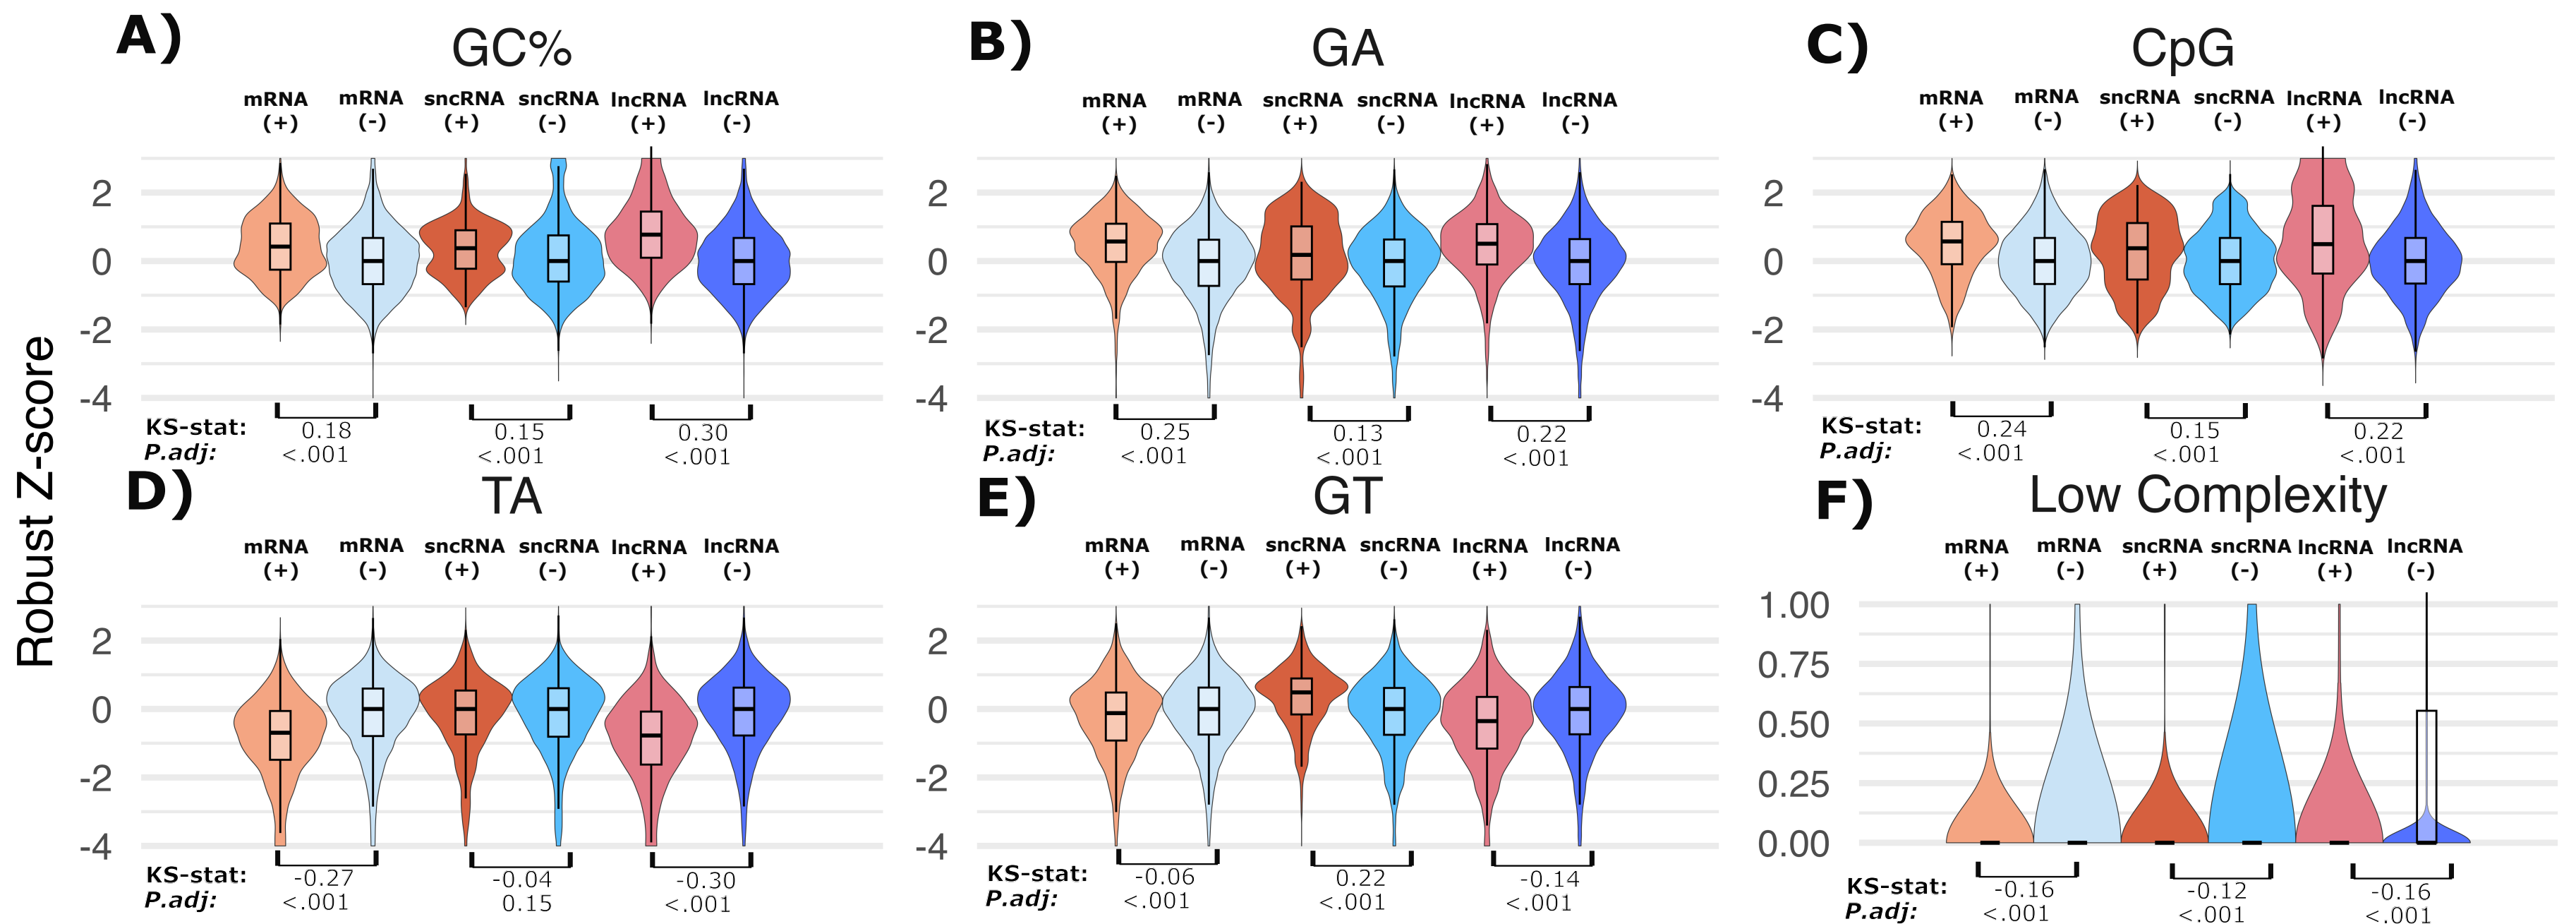

Figure 8. Violin plot and box plots for the distribution of intrinsic sequence features based on robust z-scores for genic and matched non-genic regions. A) GC%, the C+G proportion for each sequence. B-H) selected log-odds of dinucleotides proportions relative to mononucleotide frequencies for GA, CpG, TA, and GT respectively. I) Low Complexity, the proportion of sequence not classed as “low complexity” by the DUST annotation tool. The signed Kolmogorov-Smirnov statistics and adjusted p-values are displayed under each comparison.
