

Supplementary Figure S8. Correlation matrix of epigenetic features. Spearman correlation of histone and DNA modifications for mRNA, sncRNA and lncRNA sequences. Positively correlated features are displayed in red and negatively correlated features in blue. Spearman's Rho was used to determine the significance of each correlation, which were corrected for multiple testing using a Benjamini-Hochberg (BH) correction. Non-significant correlations with a p-value > 0.05 have been marked with a cross. At the bottom of the plot, KS statistics are included for each gene type as well as a mean |KS| for overall comparison
